# Anxiety and Depression among Medical Students during Exams 

FARAH AMIR ALI ${ }^{1}$, NAIMA JAVED ${ }^{2}$, FARIDA MANZUR ${ }^{3}$

#### Abstract

Aim: To find frequency of anxiety and depression among medical students of Aziz Fatima Medical \& Dental College during exams. Methods: In a cross sectional observational study, conducted by administering The Aga Khan University Anxiety \& Depression Scale (AKUADS) questionnaire to 200 students enrolled in first and second professional MBBS at Aziz Fatima Medical \& Dental College. Results: Depression was present in 121 ( $66.4 \%$ ) students during exams. Female students were more prone to depression during exams. In our study trends show more than half students had disturbed sleep, lack of habits and interest in daily routine Conclusions: In our study we found that majority of students experience depression during exams. There is need for greater attention to the psychological well being of medical students.

Keywords: Anxiety, depression, examination

## INTRODUCTION

Young medical students are considered in significant psychological distress during their training ${ }^{1}$. Several studies suggest a high prevalence of stress and depression among medical students as compared to their aged match peers ${ }^{2,3}$.

Academic demands, exams, too much work load, inability to cope, these factors are considered to be cause of depression ${ }^{4}$. Associated risk factors are female gender, having family history of depression, loss of relative and substance abuse. It has been observed that medical students have marked undue stress during pre and examination period ${ }^{5}$.

Many studies are conducted to determine anxiety and depression in medical students so far. Previous studies in Pakistan have shown higher prevalence of anxiety and depression in medical students. Anxiety and depression were found to be present in $60 \%$ and $70 \%$ according to two Pakistani studies ${ }^{6,7}$. Few studies are conducted locally to find somatic and psychiatric symptoms of anxiety and depression during examination.

## SUBJECTS AND METHODS

This study utilized a cross sectional survey design. The Aga Khan University Anxiety \& Depression Scale (AKUADS) was applied to assess the level of depression in participants with a cut off score of 19 points. It is 25 items questionnaire which includes 12 psychiatric and 13 somatic symptoms ${ }^{8}$. It was conducted by administering questionnaire to 200

students enrolled in first and second professional MBBS at Aziz Fatima Medical \& dental College. Data collection was done over three weeks during send up Viva Voce/ OSPE examination in Aug-Sep 2014. 182 students returned complete Performa. Data was compiled and descriptive analysis was done.

## RESULTS

Two hundred questionnaires were distributed, out of which 182 students returned completely filled performa. 89 students of $1^{\text {st }}$ year, 49 students of $2^{\text {nd }}$ year and 44 students of $3^{\text {rd }}$ year MBBS were participated in study. There were $114(62.6 \%)$ male participants and $68(37.3 \%)$ female participants. Depression was present in 121(66.4\%) students during exams. There were 64(56.6\%) male students and $54(79.4 \%$ ) female students score 20 or more on AKUADS. The percentage of female depressed students was significantly higher than male in all batches. $58.6 \%$ depressed students had complaint of sleeping less, while $62.8 \%$ had feeling of impending doom. $20.6 \%$ students had thought of taking their lives.

Table 1: Distribution of MBBS students along with their AKUADS scores

|  | $\mathbf{n}$ | Score 19 <br> or less | Score => 20 |
| :--- | :--- | :--- | :--- |
| $1^{\text {st }}$ year Male | 57 | $26(46.4 \%)$ | $31(54.3 \%)$ |
| $1^{\text {st }}$ year Female | 32 | $07(21.8 \%)$ | $25(78.1 \%)$ |
| $2^{\text {nd }}$ year Male | 33 | $14(42.4 \%)$ | $18(54.5 \%)$ |
| $2^{\text {nd }}$ year Female | 16 | $02(12.5 \%)$ | $14(87.5 \%)$ |

| $3^{\text {ra }}$ year Male | 24 | $09(37.5 \%)$ | $15(62.5 \%)$ |
| :--- | :--- | :--- | :--- |
| $3^{\text {rd }}$ year Female | 20 | $05(25 \%)$ | $15(75 \%)$ |

Table 2: Comparison of psychiatric symptoms in both gender scored=>20

| During the past 2 weeks: | Response | Male | Female | Total |
| :---: | :---: | :---: | :---: | :---: |

## DISCUSSION

Psychological wellbeing is essential for medical students, for the patients they met and for their future medical practice. The fear of exams is not unreasonable but excessive fear interferes with performance. Excessive worry can be very debilitating and interfere with the results if not managed properly.

In our study we found that majority of students experience depression during exams. This study shows more proportion of female medical students have depression as compare to male students. This finding is in accordance with finding of Deborah Goebert and others ${ }^{9,10}$.

In our study $66.4 \%$ students had depression. It is comparable to studies conducted in Beirut, Turkey and US ${ }^{11,12}$. We conducted this study during exams, so percentage was significantly high. This is in accordance with the study conducted on Chinese medical students ${ }^{13}$, where more than half were found to be depressed with $2 \%$ having severe depression. In our study trends show more than half students had disturbed sleep, lack of habits and interest in daily routine.

Anxiety and depression can lead to negative outcomes including medical school dropout, impaired ability to work efficiently, deterioration in relationships and increased suicidal tendency and compound existing problems of health care provision. There is need for greater attention to the psychological well being of medical students.
