

## **Collaboration on Health Issues**

World Health Organization has got to be motivated to develop an International Collaborative Forum for the reorganization of international collaboration for solutions of health crisis. This forum must be constituted in three steps. First step should be to organise societies with maximum health issues; such as uncontrolled viral & bacterial diseases. Local and international collaborative groups should be developed to analyze and make solutions for such diseases in communities with poor knowledge about the health issues.

Second group should look after societies where the clinical practices are reasonable and better health practises are available. Such societies should be helped to further strengthen their organization and health standards. Critical analysis of community health care to further improve their standards should also be improvised in such societies.

Third group should also further analyze their Health Standards and look into any future crisis in health care system for their communities. It is important because all human societies have working relationship. Food and environmental crisis are also contributing to health issues; therefore it is important that constant international analysis & control system must be operational.

The scientific pursuits for better health standards are not permanent and they have to be constantly updated. For this purpose Health Models are to be updated and discussed internationally in top priority.
